

## **Which tasks have been completed?**

---

According to our schedule, we have implemented a crawler for CampusWire to attain the data we need to process. And we have done part of the preprocessing work. Moreover, we have built a basic outline of our chrome extension and found the asset needed to build the user interface.

## **Which tasks are pending?**

---

In the data processing part, we need to decide proper scoring function and finish the classification work. In the UI part, we need to use the assets we found to make the interface better. After these, we should use the feedbacks to evaluate and improve model performance.

## **Are you facing any challenges?**

---

When writing the code of the crawler, we found that the data of the posts on the Campuswire site was not so easy to acquire, and page layout made the crawling job more complicated. When processing the data, there are many images and URLs which makes the data size too huge to handle, therefore we had to filter this kind of data and extract the core meaning of the images and URLs.
